Lancaster University Leipzig

20 July 2024

1 Introduction

The main body of hospital management information is the medical information of patients. With the deepening application of information technology in hospitals, we need to study and deal with the relationship between medical orders and patient accounting, medication, examination, treatment, etc.

The main functions of the system are patient management, doctor management, appointment management, drug management and so on.

2 Require specifications

Python - 3.11

Pycharm - 2023.1.4

Django - 4.2

Mysql - 8.2.0

3 Project framework

Front-end: HTML, CSS

Back end: Django framework

Database: SQL database

The front end is mainly responsible for the presentation and user interaction of the user interface, using HTML, CSS and JavaScript for development.

HTML: The basic structure used to build web pages. For example, use HTML tags to define basic elements such as forms, buttons, tables, and so on. CSS: used to beautify the page, JavaScript: used to achieve dynamic page interaction. Django's template engine is used to generate dynamic HTML pages. The template file is usually placed in the templates directory and rendered and returned to the client through the view function
